## Overview

### *Protocol*

The protocol used in this survey was developed by the Wisconsin Department of Natural Resources (WDNR) as a way to evaluate shoreline habitat. This survey is intended to provide management recommendations to individual property owners based on the evaluation of their property. This protocol involves photographing each parcel from the lake which is then matched to land use information about the riparian zone. For this survey, the riparian zone is defined as the strip of land, along the shore, from the high water level back 35 feet. The information collected includes ground cover type. Additional land use information includes the number of human structures in the riparian zone and various other runoff concerns. This protocol also assesses the amount of coarse woody habitat present in the lake. However this is done for the entire lake instead of for each individual parcel. Coarse woody habitat provides habitat for fish, birds, and numerous other types of wildlife as well in addition to providing some protecting from bank erosion. This protocol defines woody debris as wood in no deeper than 2 feet of water that is at least 4 inches in diameter, at the widest point, and at least 5 feet long.

### *Habitat Improvement Potential Ranking Parameters*

The potential rankings that accompany each parcel evaluation were developed by LEAPS in order to determine the needs of each lake that the survey is conducted on with concern to the projects that could realistically be completed on each parcel. The parameters used to determine the potential were considered to be those that would have the biggest impact on rainwater runoff and habitat quality. This includes percentage of canopy cover, as well as the percentage of undisturbed vegetation and a summed percentage of ground covered by manicured lawn, impervious surfaces, and easily eroded surfaces such as exposed soil or shredded vegetation such as pine needles, loose leaves, small branches, etc. also known as duff. Additional consideration was given to the number of buildings present in the riparian zone and the presence or absence of lawns that sloped directly to the lake. For each factor that was considered, there are value ranges assigned to each parameter which determine the color to be assigned, the value ranges can be seen below in table 1. Values that fall within the red range are worth 2 points, values in the yellow range are worth 1 point, and values in the white range are not given any points. The points are then summed and the properties sorted based on the point range for the entire lake.

**Table 1: Value ranges for color assignments of each parameter of concern.**

Parameter	Red range (2 points)	Yellow Range (1 Point)	White (No points)
Percent canopy cover	0-33%	34-66%	>66%
Percent shrub and herbaceous (undisturbed)	0-33%	34-66%	>66%
Percent lawn, impervious, and other surfaces	>66%	34-66%	0-33%
Number of buildings and other human structures	>1	1	0
Presence/ Absence of lawn or soil sloping to lake	N/A	1 (Present)	0 (Absent)
Presence/Absence of bare soil	1 (Present)	N/A	0 (Absent)
Presence/Absence of sand deposits	N/A	1 (Present)	0 (Absent)

*Lake-wide Summary*

To establish potential rankings for this lake, it was important to consider the entire lake. The maximum possible score was 16 points, but the highest scoring parcel only scored 8 points. From here, four levels of concern were established: red, orange, yellow, and white. These colors correspond to the potential of concern red properties are of high concern, orange are moderate, yellow is low, and white parcels are of almost no concern. Table 2 and Figure 1 summarize the survey results for the entire lake.

**Table 2: Score ranges and potential rankings for the 361 parcels surrounding Red Cedar Lake.**

Color	Overall Score	Potential	Number of Parcels
Red	6-8 Points	High	19
Orange	4-5 Points	Moderate	35
Yellow	2-3 Points	Low	51
White	0-1 Point	No Concern	255

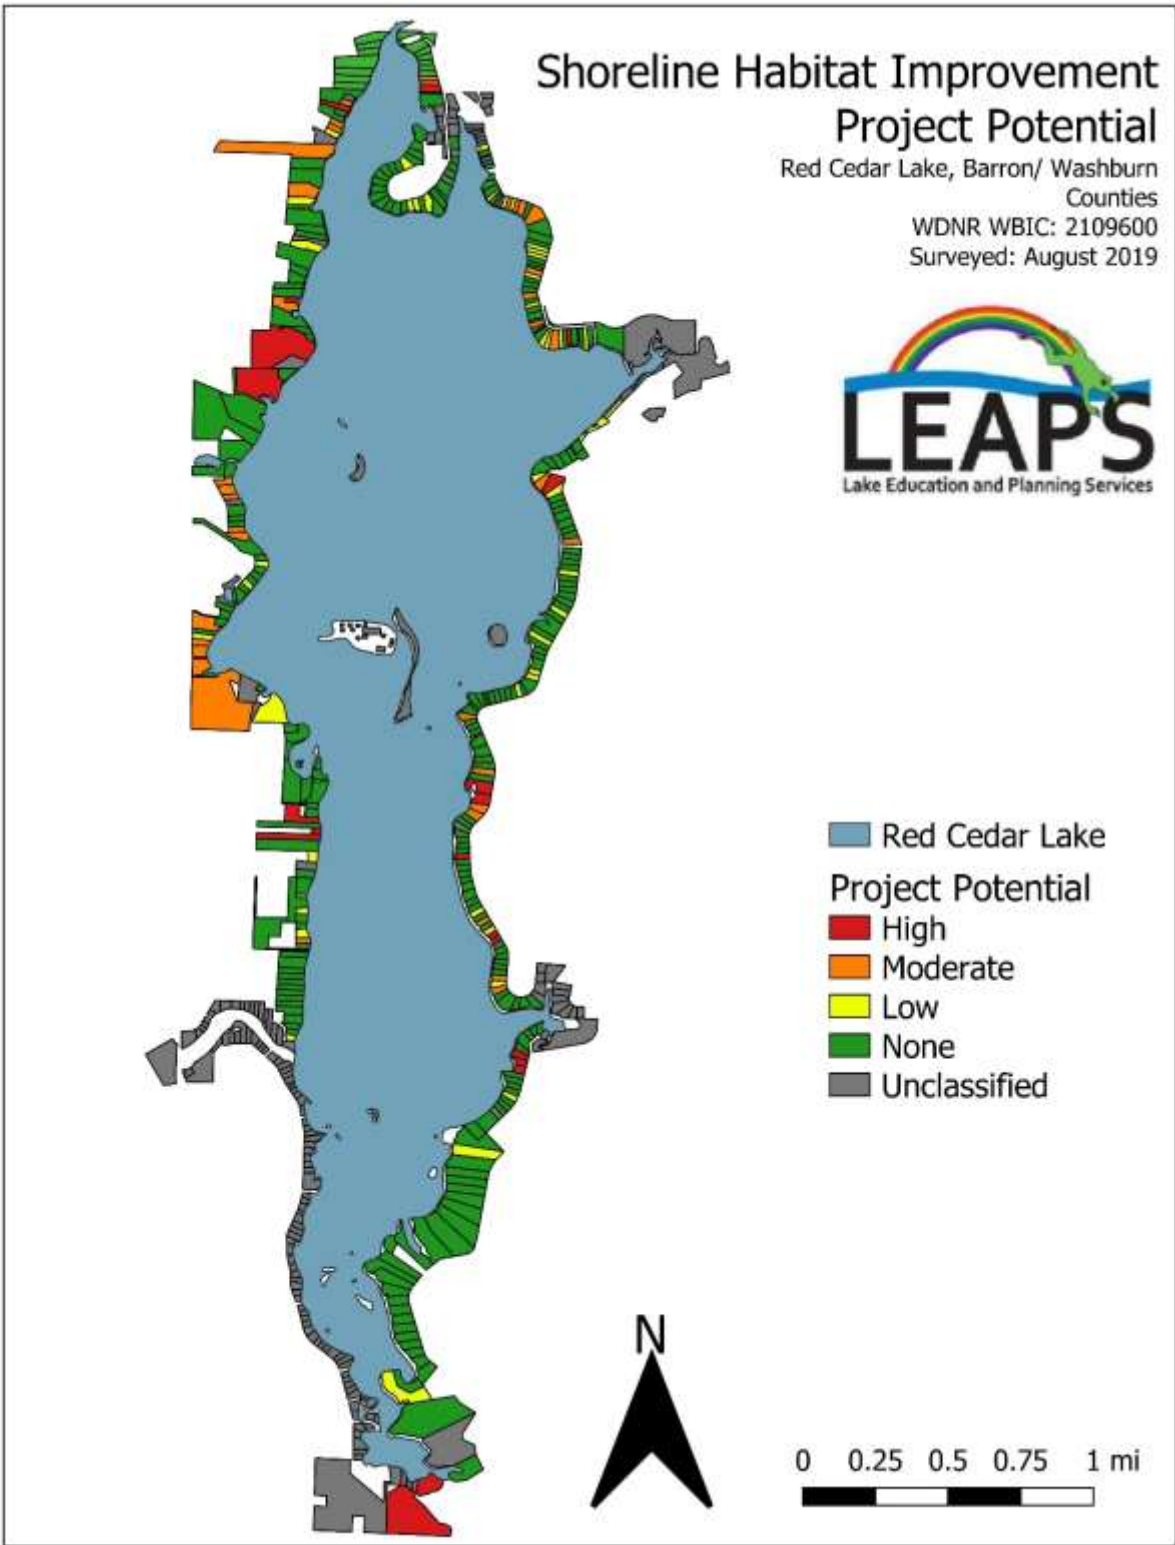

Figure 1: Shoreline Habitat Assessment Survey Results

## Potential Rankings by Parcel

The following pages are the summarized evaluations of each parcel. This will include the numbers used to determine the overall score as well as a photograph (for High, Moderate, and Low potential properties), and management recommendations for each parcel. Photos are intended to provide reference for individual property owners. These have been matched to the correct properties to our best knowledge. It is important to note that while ranking each parcel ONLY the 35-ft along the shoreline was considered. The photos were not used to assess properties and can be misleading for certain parameters, particularly canopy cover. For example, some parcels appear mostly shaded, but only have 15% canopy cover. This is likely because the assessment only considered 35-ft back and the canopy cover started beyond that mark. Additionally, there are other considerations such as camera angle, time of day, etc. All evaluations were done in the field to prevent any misdirection that would have been caused by using photos to assess the properties.

The management recommendations are explained, in more detail, in the section following the rankings. Generally speaking, there are very few recommendations for properties scoring under 3 points, so these have been marked with no potential ranking. Many of the low potential parcels would benefit from native plantings along the shore to act as a buffer zone. The high and moderate priorities would do well with rain gardens, rock infiltrations, as well as native plantings. These are all general patterns, but it is important to note that there is a good amount of variation between each parcel. To account for this, there are specific management recommendations for each parcel. The recommendations for each parcel are meant to give property owners an idea of some of inexpensive small-scale projects that would best suit the needs of their property. The projects suggested come primarily from the WDNR's Healthy Lakes Initiative which means most of them are eligible for grant funding through the WDNR.

This report includes the majority of parcels on Red Cedar Lake in both Barron and Washburn Counties. Some parcels are not accessible to be properly assessed, and a few are occasionally missed due to the limits of equipment. The parcels beginning at the mouth of the outlet channel and south will be included in the Hemlock Lake report.

COMMON AREA

Parcel number: 5427

Total Score: 7

Potential: High

Parameter	Property value	Point value
Percent canopy cover	30	2
Percent shrub and herbaceous (undisturbed)	30	2
Percent lawn, impervious, and other surfaces	70	2
Number of buildings and other human structures	1	1
Presence/ Absence of lawn or soil sloping to lake	0	0
Presence/Absence of bare soil deposits	0	0
Presence/ Absence of bare sand deposits	0	0

**Management Recommendations:**

Increase native plant cover through rain gardens or expanding the shoreline buffer, and increase tree cover.

Parcel number: 5428

Total Score: 5

Potential: Moderate

Parameter	Property value	Point value
Percent canopy cover	30	2
Percent shrub and herbaceous (undisturbed)	40	1
Percent lawn, impervious, and other surfaces	60	1
Number of buildings and other human structures	1	1
Presence/ Absence of lawn or soil sloping to lake	0	0
Presence/Absence of bare soil deposits	0	0
Presence/ Absence of bare sand deposits	0	0

**Management Recommendations:**

Increase canopy cover in native plant buffer along the shoreline.

*No photo available*

## Lake Management Best Practices (Healthy Lakes Initiative)

The Healthy Lakes Initiative is a program that has been set up by the WDNR to provide support through information and grant funding to small scale projects that will help improve both shoreline habitat and lake health. The grants available for these projects are intended for fairly small, inexpensive projects, so there is \$1000 limit in grant funding per project. This program is focused on helping individual property owners improve their shoreline. There are five projects that are eligible for Healthy Lakes Grants. The projects that qualify for these grants are installing fish sticks, rain gardens, native plantings, diversions, and rock infiltrations.

**Fish sticks** (Figure 2) is taking trees from inland, and installing them in the lake to mimic shore trees that will eventually fall into the lake. The trees used must be taken from a minimum of 35 feet inland and are then secured to the shore with cables for approximately 3 years. This provides habitat for fish, birds, and many other animals. In addition to providing habitat, fish sticks help protect the shoreline from bank erosion. Fish sticks project costs range anywhere from \$100 to \$1000, averaging about \$500. These are very low maintenance because it is only necessary to occasionally check the cables to ensure they are secure. This practice would work well for almost any of the developed parcels on the flowage.

**Figure 2: Fishsticks installation (left) and after ice out (right).**

**Rain gardens** (Figure 3) are shallow depressions that contain loose soil and native plants. These are intended to capture the runoff, allowing the water to be filtered, naturally through the ground instead of flowing directly into the lake. Rain gardens are designed to allow the rainwater to soak into the ground with 1-2 days, to prevent any of the issues created by standing water. The project cost for rain garden range anywhere from \$500 to \$9,500, but this is very dependent on the size of the rain garden. The maintenance is fairly low, only requiring watering for about two weeks, until the plants have established, and weeding is occasionally needed during the first year. This project is best suited to parcels on a smaller incline to catch rainwater runoff that would otherwise run into the lake.

**Figure 3: Rain Garden Installation (Left) and Upon Completion (Right)**

**Native plantings** (Figure 4) are intended to establish a buffer zone between the developed portion of a parcel and the lake. The buffer helps filter and slow rainwater runoff so much of it filters into the ground. This buffer zone is created by changing a strip of turf grass, at least ten feet wide, along the shoreline to a natural area composed of native shoreline plants. Similar to rain gardens, these are fairly low maintenance requiring water only until the plants have become established. The only ongoing maintenance is the removal of any invasive species that find their way into the planting. On average, native plantings cost around \$1000. This project will work for almost any developed parcel that does not have a sand beach as the primary frontage.

**Figure 4: Completed Native Planting (Photo from HealthyLakesWI.com)**

**Diversions** (Figure 5) are placed across a sloping path or driveway to divert runoff water to an area where it can be absorbed into the ground instead of flowing directly into the lake. In addition to helping improve lake health, these can also reduce the effects of erosion on the paths that the diversions are installed on. Diversions are created by entrenching a log or creating a small earthen berm approximately 30 degrees from the angle of the slope. The cost

of these range anywhere from \$25 to \$3,750, but the average diversion costs \$200. These are very low maintenance, and only require some debris removal that could get stuck in the diversion and occasionally ensuring everything is still secure and in place. This practice does not work well for the purposes of this particular survey, but it is mentioned here as a nod to projects that could be completed further inland than this survey was meant to assess.

**Figure 5: Completed Diversion** (Photo from *HealthyLakesWI.com*)

**Rock infiltrations** (Figure 6) are meant for relatively low traffic areas as a way to catch rainwater runoff and divert it into the ground. These consist of a pit which is no more than five feet deep. This pit is lined with filter fabric and filled with small rock. More filter fabric is placed on top and larger rock is then placed over that to hold everything in place. These range in price from \$500 to \$9,500, on average costing \$3800. This requires some maintenance to function properly. It is necessary to remove any debris such as leaves or pine needles that may collect. It is also necessary to occasionally clean out the rock as it collects sediment. This works well around building that can be seen in the riparian zone. The rock infiltrations allow for rainwater coming off of the roof to be collected and filtered without damaging the building it surrounds.

**Figure 6: Rock Infiltration Set-up**

### ***Example Parcels (Not From Red Cedar Lake)***

These parcels are simply meant to give property owners an idea of property owners who are able to make the most of their lakefront property while still having very little negative impact on the lake itself.

**Figure 7: Developed Parcels with a "No Potential" Ranking**

The properties shown in Figure 7 have been assessed with the same protocol as the properties surrounding the Minong Flowage, and have received potential rankings of 'None.' Each property is a little different, but in each parcel, the majority of the land within the riparian zone is comprised of undisturbed, native vegetation. The parcels that are level have some manicured lawn within that zone, but this is treated more like a well-maintained trail. For parcels with a steep slope, having a trail or stairway down to the lake while leaving the rest of the area as native vegetation works best. Not only is this the most lake-friendly approach, but the maintenance and general upkeep of this area becomes much safer, easier, and cost effective.
